12 hours uninterrupted power supply

Overview

What are uninterruptible power supply hours?

Uninterruptible Power Supply hours refer to the duration a UPS can sustain power to connected devices during an outage. This time can vary widely based on several factors, including battery capacity, load requirements, and the UPS's efficiency. Knowing how to calculate this can help you select the right UPS for your needs.

What is an uninterrupted power supply (UPS)?

An uninterrupted power supply (UPS) also referred to as a power system (UPS), is designed to provide electricity to a device in the event of a power outage or disruptions, in the power source. Knowing how long your UPS will run is key to reliable power systems; it is especially true for data centers or keeping important electronics on.

What factors affect uninterruptible power supply time?

Key factors impact uninterruptible power supply time include battery capacity, battery age and condition, load power consumption, UPS efficiency and environmental conditions. The capacity and kind of battery employed in a UPS significantly affect its capacity to store and supply power; bigger batteries with energy density can offer operating times.

How does an uninterruptible power supply work?

The uninterruptible power supplies have e.g. an adjustable maximum buffer time to protect the battery and the unit protects the battery from going into a deep discharge. Draining the battery all the way down can damage it in a very short period of time, especially if this occurs multiple times.
