

## EQACC SOLAR

# 18V solar panel light tracking self-made

## Overview

---

How does a solar tracker work?

This DIY project from Techatronic demonstrates how to create a simple, low-cost dual-axis solar tracker that automatically aligns itself toward the sun using light sensors and servo motors. [What Is a Sun Tracking Solar Panel?](#)

A sun-tracking solar panel system is designed to follow the sun's path across the sky.

How to design a solar tracker?

In modern solar tracking systems, the solar panels are fixed on a structure that moves according to the position of the sun. Let us design a solar tracker using two servo motors, a light sensor consisting of four LDRs and Arduino UNO board. The circuit design of solar tracker is simple but setting up the system must be done carefully.

Why should you use a solar tracker?

Here, the most popular use of the Sun Tracker is when we attach Solar Panel. In Solar Panel, if the Photoresistors are, then the solar panel will then check which part of it is receiving more light. Thus, adjusting the position accordingly. Which results in increased efficiency. We have then placed this Sun Tracker in our home.

How does a light tracker work?

A light tracker tracks the direction of the incoming light. It can be used along with solar panels which are programmed to move in the direction of the sun to receive the maximum amount of incident light. Solar trackers are built on the same principle to capture maximum sunlight.

## DIY Portable Solar Tracker

Pin Assignments  
Variable Declaration  
Set Input & Output  
Sensor Readings  
Solar Panel Movement  
Overnight Position  
Reset  
Source Code  
As stated before, to

determine which direction the solar panel should be facing, we are using two photoresistors as a light sensor to read the light intensity of each side of the solar panel. The programme we used will take a sample reading every 10 seconds for 10 samples, and then take the average readings from the two photoresistors to compare.
