5g base station location query

Overview

To ensure the timely reliability of the data packets transmitted in the intelligent Internet of Things, many 5 G base stations must be established as relay nodes. Thus, how to meet the transmission requirement.

How to solve the 5 G base station optimization location?

To solve the 5 G base station optimization location considering timely reliability, we propose a novel NDPR model considering the signal strength deterioration and the actual data transmission process in wireless sensor networks, which can provide better service qualities for the users.

Why do we need a 5G base station?

In order to meet the development trend of the fast pace of 5G, improve users' 5G use experience, reduce insufficient signal coverage, and other problems, more base stations need to be established to cope with the high requirements of 5G on the network.

What is the location optimization approach for 5G BS?

The location optimization approach for 5G BSs aims to cover the service demand area with the minimum number of BSs or to maximize the service coverage area of a given number of BSs. To solve this typical coverage problem, an MCLP model was employed for the location optimization of 5G BSs.

What is 5 G base station location problem?

5 G base station location problem can be abstracted as a network design problem with relays (NDPR), which has attracted a lot of attention , , , , , , , , , . This problem was first proposed by Cabral et al. (2007) .
