Alofi Micro Inverter Unit Price

Overview

What is a solar micro inverter?

A solar micro inverter is a plug-and-play device used in photovoltaics, which converts direct current (DC) generated by a single solar module to alternating current (AC). Micro inverters contrast with conventional string and central solar inverters, in which a single inverter is connected to multiple solar panels.

How much does a micro inverter cost?

They typically cost \$1,000 or more than a string inverter on a standard 5kW residential solar installation. However, they allow for a much easier system expansion than a string inverter and ensure greater energy savings. It means that in the long term, micro inverters for solar systems may turn out to be cheaper than conventional inverters.

Should I convert my solar panel to a micro inverter?

When DC-AC conversion happens on the panel level, there's never any high-voltage power traveling through your system. So you don't need to worry about the dangers lurking on your own roof. Micro inverters are relatively expensive since they need to be affixed to the back of every single solar panel.

How long does a micro inverter last?

The lifespan of a solar cell module is generally twenty years, and the lifespan of a micro-inverter should be comparable to that of a solar cell module. Micro inverters often use robust materials and designs to withstand harsh environmental conditions, also contributing to their longevity.
