

**EQACC SOLAR**

# **Base station battery discharge test current**

## Overview

---

What is battery charge/discharge testing?

Battery charge/discharge testing is carried out as part of performance tests during battery cell, module, and pack development and during the evaluation stage. This type of testing allows manufacturers to inspect the battery's charge and discharge performance as well as its service life.

How to perform a battery discharge test?

The discharge test is started with the high current rate and when T1 is reached, the voltage at the battery terminals is recorded. Reduce the current to the second rate and proceed with the discharge test. A type 2 modified performance test is used when the duty cycle is more complex.

How to test a battery bank?

There are a number of different tests like: visual inspections, specific gravity, float voltage and current measurements, discharge test, individual cell condition, inter-cell resistance, and others, which are recommended in IEEE, NERC and other standards for diagnosing the condition of the battery banks.

When was a battery discharge test performed?

The discharge test was performed on a battery bank with 56 cells and 112 V (2 Volts/cell) installed in Jan 2003. Its published ratings are shown in Table 2. The average cell temperature measured was 20 °C. A performance test was conducted at a constant discharge current of 95.1 A for a 3 hour time duration using the time adjusted method.
