Base station power module setting requirements

Overview

Can a base station power system model be improved?

An improved base station power system model is proposed in this paper, which takes into consideration the behavior of converters. And through this, a multi-faceted assessment criterion that considers both economic and ecological factors is established.

Can a base station power system be optimized according to local conditions?

The optimization of PV and ESS setup according to local conditions has a direct impact on the economic and ecological benefits of the base station power system. An improved base station power system model is proposed in this paper, which takes into consideration the behavior of converters.

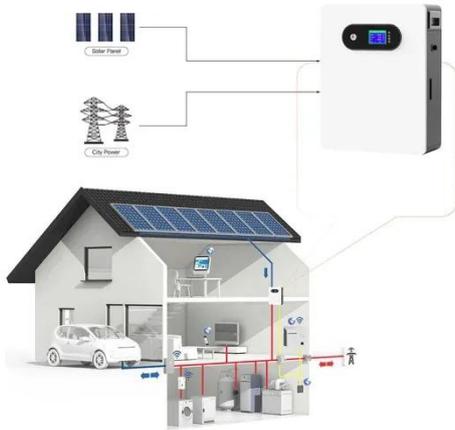

What is the maximum output power of a base station?

In extreme conditions, the base station maximum output power, $P_{max,c}$, shall remain within +2.5 dB and -2.5 dB of the rated output power, $P_{rated,c}$, declared by the manufacturer. In certain regions, the minimum requirement for normal conditions may apply also for some conditions outside the range of conditions defined as normal.

What are RF requirements for a base station?

In the base station specifications, there is one set of RF requirements that is generic, applicable to what is called “general purpose” base stations. This is the original set of UTRA requirements developed in 3GPP release 99. It has no restrictions on base station output power and can be used for any deployment scenario.
