Bidirectional charging of photovoltaic containers for urban lighting

Overview

How can bidirectional charging/discharging a battery achieve maximum PV power utilization?

In addition, with the proposed strategies, the bidirectional charging/discharging capability of the battery is able to achieve the maximum PV power utilization. All the proposed strategies can be realized by the digital signal processor without adding any additional circuit, component, and communication mechanism.

What is EV bidirectional charging?

Unlike unidirectional charging, bidirectional charging distributes excess PV power more effectively, maximizing the benefits of solar generation and supporting energy demand more efficiently. The use of EV bidirectional technology reduces total electricity consumption.

How does a bidirectional charging system work?

For the bidirectional charging system depicted in Fig. 4 b, the PV system charges the EV battery via unidirectional charging but introduces a discharging functionality to manage the energy distribution dynamically. This prevents the SOC from remaining fully discharged at 100% SOC, as energy is discharged when needed.

Is bidirectional charging better than unidirectional charging?

For example, with three EVs, bidirectional charging results in a grid purchase of 90 kWh compared with 92 kWh for unidirectional charging, despite higher total consumption. Considering this, bidirectional systems can be more efficient and require less energy from external sources, even as fleet sizes increase.

Bidirectional charging of photovoltaic containers for urban lighting

Bidirectional Power Flow Control and Hybrid Charging Strategies ...

The objective of this article is to propose a photovoltaic (PV) power and energy storage system with bidirectional power flow control and hybrid charging strategies. In order to ...
