

**EQACC SOLAR**

# **Dhaka crystalline silicon solar module glass**

## Overview

---

What is crystalline silicon photovoltaics?

Crystalline silicon photovoltaics is the most widely used photovoltaic technology. Crystalline silicon photovoltaics are modules built using crystalline silicon solar cells (c-Si). These have high efficiency, making crystalline silicon photovoltaics an interesting technology where space is at a premium.

What is a monocrystalline silicon solar module?

Monocrystalline silicon represented 96% of global solar shipments in 2022, making it the most common absorber material in today's solar modules. The remaining 4% consists of other materials, mostly cadmium telluride. Monocrystalline silicon PV cells can have energy conversion efficiencies higher than 27% in ideal laboratory conditions.

What type of glass is used for solar panels?

Crystalline silicon solar cells are connected together and then laminated under toughened or heat strengthened, high transmittance glass to produce reliable, weather resistant photovoltaic modules. The glass type that can be used for this technology is a low iron float glass such as Pilkington Optiwhite™.

What is a solar module?

A solar module—what you have probably heard of as a solar panel—is made up of several small solar cells wired together inside a protective casing. This simplified diagram shows the type of silicon cell that is most commonly manufactured. In a silicon solar cell, a layer of silicon absorbs light, which excites charged particles called electrons.
