# **Disadvantages of Ground Outdoor Base Stations**

## Overview

---

Do mobile phones need a base station?

Mobile phones and other mobile devices require a network of base stations in order to function. The base station antennas transmit and receive RF (radio frequency) signals, or radio waves, to and from mobile phones near the base station. Without these radio waves, mobile communications would not be possible.

Why do we need more base station antennas?

As the number of mobile devices in a community grows, more base stations are needed. For that reason, more antennas are needed in such crowded locations as shopping malls where there are many mobile phone users. However, the shorter the distance between base station antennas, the lower the output power of each antenna.

Are solar powered base stations a good idea?

Base stations that are powered by energy harvested from solar radiation not only reduce the carbon footprint of cellular networks, they can also be implemented with lower capital cost as compared to those using grid or conventional sources of energy . There is a second factor driving the interest in solar powered base stations.

How does the range of base stations affect energy consumption?

This in turn changes the traffic load at the BSs and thus their rate of energy consumption. The problem of optimally controlling the range of the base stations in order to minimize the overall energy consumption, under constraints on the minimum received power at the MTs is NP-hard.

## Disadvantages of Ground Outdoor Base Stations

---

### Preventing theft and vandalism on the mobile base station

Increased cases of vandalism and theft targeting base stations have resulted in increased mobile operators OpEXs every year. The rate of vandalism and theft, especially multiple recurring ...
