Does a generator set need a substation

Overview

What is a generator substation?

A generating substation is responsible for stepping up the voltage from the generator's lower voltage to a higher voltage. This makes it more suitable and economical for transmitting electric power over longer distances with less power losses caused by the impedances of transmission lines.

What do you need to know about substations?

The basic things about substations you **MUST** know in the middle of the night! In a less simple way, substation is the key part of electrical generation, transmission, and distribution systems. Substation transforms voltage from high to low or from low to high as necessary.

Who can own a substation?

Substations may be owned and maintained by manufacturing, industrial, or large commercial customers, instead of being owned and maintained by the power utility. Alternatively, they can be owned by the power utility. Substations can operate at many different voltage levels.

What if there were no electrical substations?

Without a strong network of electrical substations, human civilization would not be where it is today. In simple words, an electrical substation is a facility where voltage is either stepped up or stepped down to make sure we can transmit electricity across long distances with safe distribution to the end consumer.

Does a generator set need a substation

Does a substation need a generator

Primary Substation Equipment
 Generators A generator converts various forms of energy into electrical energy through electromagnetic induction. Generators come in many

The basic things about substations you MUST know in the ...

Substation
Equipment Transformers Circuit
Breakers Disconnecting
Switches Substation Bus Surge
Arresters Insulators and
Conductors Protective
Relays Fuses Substation Location All power
transmission lines must be isolated to
avoid safety hazards. Large strings of
insulators are used at substations and at
other points along the power distribution
system to isolate the current carrying
conductors from their steel supports or
any other ground mounted equipment.
Insulators may be made of porcelain,
rubber or a thermoplastic See more on
