# Does floating glass have anything to do with solars

## Overview

---

What is floating glass?

**Key applications and benefits** Float glass is a flat, transparent sheet of glass made by floating molten glass on a bath of molten tin. Also known as flat glass, annealed glass, or soda-lime glass, it's widely used in windows, doors, mirrors, furniture, automotive glass, solar panels, and electronic displays.

Why is float glass important?

With the float method, glassmakers could produce large, flawless panels — uniform in thickness, crystal-clear, and ready to use. It was a turning point for modern construction, design, and manufacturing. Float glass is also known by other names: At its core, float glass is a starting point — a base layer.

Does float glass hold up?

Glass may seem fragile, but float glass holds up. It resists moisture, UV light, and most chemicals in the air or rain. That's why it lasts in outdoor facades, greenhouses, and appliances alike. The float process doesn't just make good glass — it makes it at scale.

Is float glass good quality?

Compared to most other modern glass types, float glass is typically affordable for most projects. When considering a high-quality glass manufacturer like Shenxun, it offers the best price for float glass without compromising any aspect of quality. **Which Raw Materials Are Used for the Production of Float Glass?**
