

Does the UPS need to be plugged in all the time

Overview

Should a ups be plugged in or left turned on?

UPS units should be plugged in and left turned on at all times. Unfortunately, powering off the UPS each day will cause the UPS battery to age faster than if you leave it powered on at all times. If the UPS runs a self test each time it powers on like all APC UPS units do, the UPS will run on battery each time you power it on.

Should a ups be connected to power?

A UPS should always be connected to power. This way, the battery is always fully charged, for when it is needed. If you disconnected it from power, there is a chance that it would not be reconnected, and then will fail at its single task when needed. Why would you want to shut off the UPS?

The point is for it to provide backup power.

Do I need an ups if I'm in a power outage?

If you're in an area where power is flickering on and off, having your networking gear connected to a UPS will at the very least stop your gear from power cycling with the rest of the house; it'll also obviously keep your Internet connection up and operational. If you're in a multi-hour power outage, this will help a bit less.

What is a ups & how does it work?

A UPS bridges the gap between the power outage and the restoration of electricity or the time to safely shut down devices. It consists of a battery backup, an inverter, and a rectifier. Battery Backup: Stores energy to supply power when the main source fails. Inverter: Converts stored DC power to AC power for your devices.

Does the UPS need to be plugged in all the time

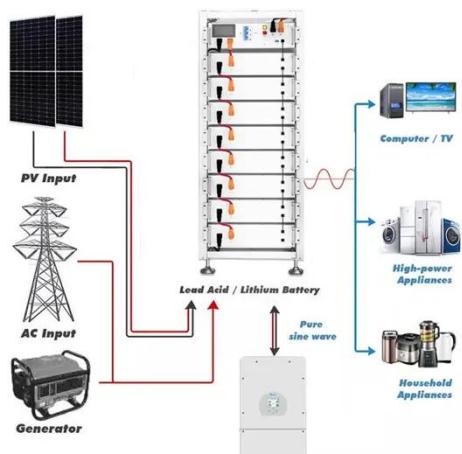

Proper Use of UPS Units

Hi Bernd, UPS units should be plugged in and left turned on at all times. Unfortunately, powering off the UPS each day will cause the UPS battery to age faster than if ...
