

**EQACC SOLAR**

# **Energy storage construction cost and service life**

## Overview

---

Are mechanical energy storage systems cost-efficient?

The results indicated that mechanical energy storage systems, namely PHS and CAES, are still the most cost-efficient options for bulk energy storage. PHS and CAES approximately add 54 and 71 €/MWh respectively, to the cost of charging power. The project's environmental permitting costs and contingency may increase the costs, however.

What is multi-energy storage performance?

Multi-energy storage performance under different scenarios: (a) Lithium iron phosphate battery energy storage, (b) pumped storage, (c) compressed air energy storage, and (d) hydrogen energy storage. The EES for the renewables scenario focuses on the economic indicators of energy storage.

What is the cheapest energy storage system?

In terms of TCC (total capital cost), underground CAES (with 890 €/kW) offers the most economical alternative for bulk energy storage, while SMES and SCES are the cheapest options in power quality applications. However, the cost data for these electro-magnetic EES systems are rather limited and for small-scale applications.

Why do we need energy storage technology?

Improving this flexibility is key to achieving a high proportion of renewable energy consumption. In this context, the scientific selection of energy storage technology is of great significance for the construction of new power systems.
