Energy storage power station data transmission method

Overview

How do energy storage monitoring systems work?

There are two data sources for the energy storage monitoring system: one is to access the data center through the power data network; the other is to directly collect the underlying data of the energy storage station. The two ways complement each other.

How do energy storage power stations perform state evaluation & performance evaluation?

At the terminal of the system, the state evaluation, performance evaluation and fault analysis of the batteries in the energy storage power station are carried out through horizontal and vertical data analysis. Through edge computing, system operation data and evaluate system operation status.

What is energy storage system architecture?

The system realizes the functions of information collection, integration and monitoring of the energy storage station. Grid tide and load data, wind power and photovoltaic data are also connected, as well as related forecasts. In this system architecture, the collected data is uploaded to the data center.

What is aggregation management of distributed energy storage devices?

The aggregation management of distributed energy storage devices which connected to user side can be realized based on 5G and 4G wireless communications or wired monitoring networks such as TCP /IP. And after the security isolation and encryption, it can be access to power system control network.
