# First control the cius uninterruptible power supply

### DISTRIBUTED PV GENERATION + **ESS**

## Overview

---

What is an uninterruptible power supply in a control system?

Uninterruptible power supplies in control systems can take on different dimensions depending on the type of subsystem. Data centers and server rooms, which play a vital role within many modern automated system infrastructures, are where integrating UPS units is most common and well-studied.

What is an uninterrupted power supply (UPS) system?

Abstract. In the modern world, when there is a power outage or a power failure, telecommunication systems, computer systems, and many other critical equipment, such as medical equipment, require uninterrupted power to support their operation. Uninterruptible power supply (UPS) systems are used for this purpose.

Why do we need uninterruptible power supplies?

However, during transmission and distribution, it is subject to voltage sags, spikes and outages that can disrupt computer operations, cause data loss and damage equipment. The uninterruptible power supplies protect the connected equipment from power problems and provide battery backup during power outages.

When was the first continuous power supply invented?

The first concepts of continuous power supply were introduced in the early 20th century, with the first patent for a UPS device granted in 1934. Several decades later, the modern UPS appeared in the PC era at a time when hard drives were less resistant than those we see today.
