

# Flow Battery Transport

## Overview

---

What is a flow battery?

Flow batteries are promising large-scale energy storage technologies for smart grids and broad applications of renewable energies. Ion conductive membranes (ICMs) are the crucial components in flow batteries to resist electrolyte crossover and selectively transport charge carriers.

Are flow batteries the future of energy storage?

Flow batteries are promising due to their use of inexpensive, Earth-abundant reactants, and ability to readily upscale because of a spatial decoupling of energy storage and power delivery. To reduce system capital costs, single-flow membraneless flow batteries are under intense investigation, but require intricate flow engineering.

What are redox flow batteries?

Redox flow batteries (RFBs) are an emerging electrochemical technology envisioned towards storage of renewable energy. A promising sub-class of RFBs utilizes single-flow membraneless architectures in an effort to minimize system cost and complexity.

Can single-flow membraneless flow batteries reduce system capital costs?

To reduce system capital costs, single-flow membraneless flow batteries are under intense investigation, but require intricate flow engineering. In this work, we analytically and numerically model the flow and chemical species transport for a novel single-flow geometry, and show enhancement of reactant transport and separation.
