# **High-efficiency energy storage container for airport use in Amsterdam**

## Overview

---

Does Schiphol Airport have a long-duration energy storage system?

To make this happen, Schiphol Airport is introducing a long-duration energy storage (LDES) system manufactured by ESS Technology Inc. (ESS Inc.). Under this system, the current polluting diesel ground power units used to power aircraft parked at airport gates will be phased out and replaced with electric ground power units (E-GPUs).

How will ESS work at Amsterdam Airport Schiphol?

The ESS system will enable Amsterdam Airport Schiphol to phase-out polluting diesel ground power units that currently supply electrical power to aircraft while parked at airport gates. These will be replaced with Electric Ground Power Units (E-GPUs).

How can Amsterdam Airport decarbonise its ground power units?

One of these innovations is the electrification of its ground power units. Amsterdam Airport Schiphol is taking action to decarbonise its ground operations by 2030. This effort is part of the EU-funded TULIPS project that aspires to speed up the implementation of novel, sustainable technologies to reduce carbon emissions at European airports.

Will Amsterdam Airport Schiphol achieve a decarbonisation goal?

“Amsterdam Airport Schiphol has set an ambitious goal for decarbonisation and has provided great leadership in taking the necessary actions to make it real,” remarks Eric Dresselhuys, CEO of ESS Inc. “This project provides a blueprint for LDES to safely provide clean, reliable energy in airport operations and reduce fossil fuel dependence.
