# How much does it cost to store energy to generate one watt of electricity

## Overview

---

As of recent estimates, the average cost is around \$250 to \$400 per kilowatt-hour (kWh) of storage capacity, equating to approximately \$0.25 to \$0.40 per watt, depending on system design and size. How much does energy storage cost?

Energy storage system costs for four-hour duration systems exceed \$300/kWh for the first time since 2017. Rising raw material prices, particularly for lithium and nickel, contribute to increased energy storage costs. Fixed operation and maintenance costs for battery systems are estimated at 2.5% of capital costs.

Is all energy created equal?

Not all energy has been created equal – and that also applies to the cost of electricity generation. This also largely has to do with how much funding has gone into the research and development of these power sources over time, and also the scale of production.

What is the cost structure of electricity generation technologies?

Cost structure of generation technologies. Electricity generation technologies vary dramatically in their cost structure. Some plants, such as nuclear, wind and solar power, have virtually zero variable costs. This is in stark contrast to fossil fuel based power plants.

Why do we need energy storage costs?

A comprehensive understanding of energy storage costs is essential for effectively navigating the rapidly evolving energy landscape. This landscape is shaped by technologies such as lithium-ion batteries and large-scale energy storage solutions, along with projections for battery pricing and pack prices.
