

# How much energy storage can generate 100 million kWh of electricity per year

## Overview

---

What is an energy storage system?

An energy storage system (ESS) for electricity generation uses electricity (or some other energy source, such as solar-thermal energy) to charge an energy storage system or device, which is discharged to supply (generate) electricity when needed at desired levels and quality. ESSs provide a variety of services to support electric power grids.

How can energy storage support the global transition to clean electricity?

To support the global transition to clean electricity, funding for development of energy storage projects is required. Pumped hydro, batteries, hydrogen, and thermal storage are a few of the technologies currently in the spotlight.

How much energy is stored in a terrawatt-hour (TWh)?

Scaling storage capacity up to 10,000 TWh allows to store a month of final energy and several months of electricity. Table 1: Global energy consumption in 2018, and average storage time for energy storage of 1.0 and 10,000 TerraWatt-hour. Data source - EU.

How will energy storage affect global electricity production?

Global electricity output is set to grow by 50 percent by mid-century, relative to 2022 levels. With renewable sources expected to account for the largest share of electricity generation worldwide in the coming decades, energy storage will play a significant role in maintaining the balance between supply and demand.

## How much energy storage can generate 100 million kWh of electricity?

### Home Energy Storage (Stackble system)

- High Efficiency
- Easy installation
- Safe and Reliable
- Perfect Compatibility

#### Product Introduction

- Scalable from 10 kWh to 50 kWh
- Self-Consumption Optimization
- Integrated with inverter to avoid the compatibility problem
- LFP battery, safest and long cycle life
- Stackble design,easy installation
- Capable of High-Powered Emergency-Backup and Off-Grid Function
