How to control the discharge current of the battery cabinet

Overview

How do you perform a cyclic charge and discharge profile?

Perform a cyclic charge and discharge profile on a battery module by using the Battery CC-CV block. At the start of the simulation, the battery module has a state of charge (SOC) of 10%.

How does cyclically charge and discharge a battery module?

Cyclically charge and discharge a battery module while estimating the state of charge (SOC) of the three parallel assemblies of the module over time. This example uses the SOC estimation to switch between the charging and discharging profiles.

What is a wide voltage battery discharge cabinet (dual channel)?

The wide voltage battery discharge cabinet (dual channel) can monitor real-time parameters such as battery voltage, discharge current, discharge time, and discharge capacity during the battery discharge process.

How do you charge a battery module using a CC-CV profile?

When the battery is charging, the current is constant until the battery reaches the maximum voltage and the current decreases to 0. When the battery is discharging, the model uses a constant current. Charge a battery module using a constant-current step followed by a constant-voltage step. This is a CC-CV profile.

How to control the discharge current of the battery cabinet

Current Management

Battery Charging and Discharging Use a constant current and constant voltage algorithm to charge and discharge a battery. The Battery CC-CV block is charging and discharging the ...
