## Overview

---

Why should you choose Sunguard solar plus glass?

The high durable coating of SunGuard Solar Plus glass makes it suitable for lamination with the coating against the PVB interlayer, without requiring edge deletion. SunGuard Solar Plus glass can also deliver optical clearness while helping to reduce energy consumption.

Can solar panels still generate power if placed behind glass?

Yes, solar panels can still generate power when placed behind glass, but their efficiency drops significantly. This is due to several factors: Glare and Reflection: Windows with insulation or UV protection coatings can reflect even more sunlight away from the panels.

What happens if a solar panel is placed behind glass?

Glass reflects, diffuses, and sometimes absorbs light. When solar panels are placed behind standard glass, several things happen: Reflection: A portion of sunlight bounces off the glass and never reaches the panel. Diffusion: Light is scattered and becomes less concentrated. Absorption: Some energy is absorbed by the glass itself.

How does glass affect solar energy?

Reduced Light Intensity: Glass can block or reflect part of the sunlight, particularly UV rays, which are important for solar energy generation. The angle of Incidence: Sunlight passing through the glass at an angle can scatter, reducing the intensity that hits the panel.
