Currently, the energy grid is changing to fit the increasing energy demands but also to support the rapid penetration of renewable energy sources. As a result, energy storage devices emerge to add buffer capacity and to reinforce residential and commercial usage, as an attempt to improve the overall utilization of the available green energy. Although various research has been conducted in the field including photovoltaic and wind applications, the study on suitability identification of different storage devices for various stationary application types is still the gap observed which needs further study and verification. The review performed fills these gaps by investigating the current status and applicability of energy storage devices, and the most suitable type of storage technologies for grid support applications are identified. Currently, the globe is still fronting a challenge in the sector of energy with the lack of reliable energy sources at moderate charges and environmental reparations triggered by polluting energy sources, such as coal. For mitigation of this problem, countries are adopting various types of renewable energy sources (RESs). Wind and solar RESs are predicted to supply 50% of the world's energy demand by 2050 [1] while the electricity demand only from the electric vehicles (EVs) is going to reach a 6% increase i.e. approximately 2 TWh by 2040 of the total electricity produced [2]. According to the BNEF report of the global power generation mix, from 1970 to 2017, compared to renewable sources, fossil fuels have a large share in the generation mix and energy supply system. However, from 2018 onwards, the energy contribution sh.
