Lightning protection solar container communication station lead-acid battery setting requirements

Overview

Do vented lead acid batteries need a separate battery room?

Vented lead acid batteries installed in medium voltage main substation buildings and unit substations, electrical equipment rooms and control system rack rooms shall not require a separate, dedicated battery room and shall be in accordance with SES E14-S02. The battery room and installation shall comply with IEEE 484, NFPA 70 and OSHA 29 CFR.

Where should lead acid batteries be located?

Vented lead acid batteries shall be located in rooms with outside air exchange, or in well-ventilated rooms, arranged in a way that prevents the escape of fumes, gases, or electrolyte spray into other areas. Ventilation shall be provided to ensure diffusion of the gases from the battery, to prevent the accumulation of an explosive mixture.

What are the different types of lead acid batteries?

There are two types of lead acid batteries: vented (known as “flooded” or “wet cells”) and valve regulated batteries (VRLA, known as “sealed”). The vented cell batteries release hydrogen continuously during charging while the VRLA batteries release hydrogen only when overheated and/or overcharged.

What are the ventilation requirements for a room or area housing battery?

Unless exempted below, ventilation requirements for a room or area housing batteries are required to be as per manufacturer installation instruction, or calculated by a competent person (such as mechanical designer). Vented type batteries connected to a charging device with a power output of less than 200 Watt.
