# Multi-layer installation of solar panels

## Overview

---

What materials are used in a multi-junction solar cell?

Instead, materials like gallium indium phosphide (GaInP), indium gallium arsenide (InGaAs), and germanium (Ge) are used to create separate layers of semiconductors that all respond to different wavelengths of incoming sunlight. Layers in a multi-junction solar cell. Source: .

What is dyMat® solar panel film?

The dyMat® range of solar panel films offers solutions for all types of pv modules in any installation environment. dyMat® photovoltaic laminates, suitable for up to 1500 VDC, feature a wide choice of polyester and fluorinated materials, mono and multilayer structures, different colour and several output enhancing options.

How are multi-junction solar cells made?

Multi-junction solar cells are not made using silicon as a semiconductor. Instead, materials like gallium indium phosphide (GaInP), indium gallium arsenide (InGaAs), and germanium (Ge) are used to create separate layers of semiconductors that all respond to different wavelengths of incoming sunlight.

How many junctions should a solar panel have?

Adding more junctions (potentially up to 5 or 6 junctions) could boost efficiency by over 70 percent. For reference, the most efficient solar panels available today have efficiencies of around 22 percent.
