

EQACC SOLAR

Palikir Super Capacitor

Overview

The Electric double-layer capacitor (EDLC) or super-capacitors are becoming increasingly popular for their high specific power and for integrating that feature with batteries, which have a high specific energy.

Are supercapacitors suitable for pulse power applications?

Supercapacitors are ideally suited for pulse power applications, due to the fact the energy storage is not a chemical reaction, the charge/discharge behavior of the supercapacitor is efficient. Supercapacitors are utilized as temporary energy sources in many applications where immediate power availability may be interrupted.

What is a supercapacitor capacitor?

Also known as an ultracapacitor or Electrical Double-Layer Capacitor (EDLC), supercapacitors possess a very high capacitance value compared to other regular capacitors. These high-capacitance capacitors have low voltage limits. A major reason for choosing these capacitors over regular ones is that they feature higher power density.

Can a super-capacitor power a new energy storage system?

Researchers were combining the super-capacitor technology along with the battery and made a new energy storage system which will be applicable in various industrials and other regular applications. These two technologies (battery and super-capacitors) is required for solving simultaneously two different problems.

Why are supercapacitors not widely used?

Despite their benefits, supercapacitors have several problems that prevent them from being widely utilized. Their reduced energy density in comparison to batteries is one of the primary problems. Supercapacitors usually have an energy density of 5–10 Wh/kg, which limits their use in applications that need long-term energy storage.
