

# Peak-valley arbitrage of Israel's energy storage power station

## Utility-Scale ESS solutions

## Overview

---

What is Peak-Valley arbitrage?

The peak-valley arbitrage is the main profit mode of distributed energy storage system at the user side (Zhao et al., 2022). The peak-valley price ratio adopted in domestic and foreign time-of-use electricity price is mostly 3-6 times, and even reach 8-10 times in emergency cases.

How does reserve capacity affect peak-valley arbitrage income?

However, when the proportion of reserve capacity continues to increase, the increase of reactive power compensation income is not obvious and the active output of converter is limited, which reduces the income of peak-valley arbitrage and thus the overall income is decreased.

When is energy storage charged & discharged?

Usually, the energy storage is charged at night when the price is at valley stage, and discharges during the daytime when the power consumption is at peak, so as to achieve peak-valley arbitrage and save cost.

What is Peak-Valley price ratio?

The peak-valley price ratio adopted in domestic and foreign time-of-use electricity price is mostly 3-6 times, and even reach 8-10 times in emergency cases. It is generally believed that when the peak-valley price difference transcends 0.7 CNY/kWh, the energy storage will have the peak-valley arbitrage profit space (Li and Li, 2022).

## Peak-valley arbitrage of Israel's energy storage power station

### Model and Method of Capacity Planning of Energy Storage ...

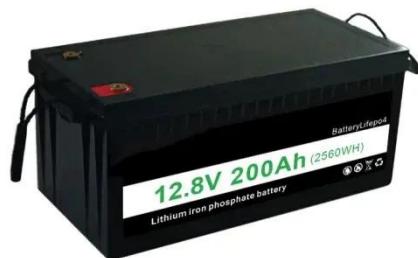

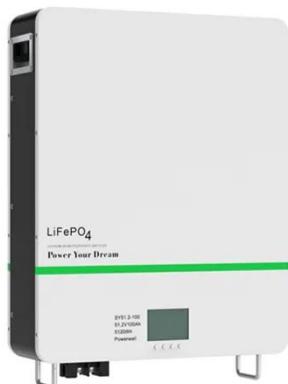

Energy storage power station is an indispensable link in the construction of integrated energy stations. It has multiple values such as peak cutting and valley filling, peak ...
