RF solar container communication station hybrid energy settings

Overview

What is a hybrid solar and RF energy harvester?

A hybrid solar and RF energy harvester is proposed for applications in self-powered wireless sensor nodes. A planar slot antenna array backed by substrate integrated waveguide (SIW) cavity is produced for RF energy harvesting. A designed rectifier connected to the antenna array converts the received RF energy into DC energy.

How does RF energy harvesting work?

When the sun's radiation strikes a solar panel, energy from the sunlight is absorbed by the solar cells. If an RF energy harvester is integrated with solar cells to form a hybrid solar and RF energy harvesting system [11, 12], then the efficiency and reliability of capturing energy can be increased.

Can a hybrid solar and RF energy harvester be used in spwsns?

A hybrid solar and RF energy harvester for applications in SPWSNs has been proposed in this paper. A planar slot antenna element backed by substrate-integrated waveguide cavity was designed at first. Then, based on the antenna element, an 8×8 antenna array operating at 5.8 GHz was built to receiving the RF energy with a high gain.

Can a flexible RF and solar energy harvesting system power wearable electronic devices?

Abstract: In this article, we demonstrate a flexible and wearable hybrid radio frequency (RF) and solar energy harvesting system for powering wearable electronic devices. The system consists of a flexible transparent antenna, a flexible transparent rectifying circuit, and an amorphous silicon solar cell.
