# Relationship between solar inverter and energy storage

## Overview

---

What is the relationship between solar PV and storage?

When solar PV and storage are considered simultaneously, the concurrent shift in the net load profile suggests a symbiotic relationship: storage can be dispatched during hours when solar exhibits diminished output, and solar helps to shorten the durations of peak load that must be shaved by energy-limited storage systems.

Can solar PV and energy storage be used together?

When used concurrently on a power system, we found that the total capacity value provided by solar PV and energy storage consistently exceeds the sum of the capacity values for the two technologies when used separately.

Are photovoltaic inverters the same?

As the core component of photovoltaic power generation and energy storage systems, inverters are famous. Many people see that they have the same name and the same field of action and think that they are the same type of product, but this is not the case.

Can a photovoltaic inverter generate electricity during the day?

Photovoltaic inverters can only generate electricity during the day, and the power generated is affected by the weather and has unpredictability and other issues. The energy storage converter can perfectly resolve these difficulties. When the load is low, the output electric energy is stored in the battery.
