What is a rooftop solar photovoltaic system?

A rooftop solar photovoltaic (PV) system uses solar panels mounted on the roof of a building to convert sunlight into electricity. Rooftop solar systems rely on the photovoltaic effect, where cells generate electricity in response to sunlight.

How to mount solar panels on a roof?

The mounting of solar panels on rooftops depend on the slope of the roof and for residential building, the roof mounts are aligned with the slope of the roof. For commercial or industrial buildings, the roofs are often flat and there are roof mounts for such systems as well. These are covered below:.

How does a rooftop solar PV system work?

Converts solar energy into electricity. This can be used to meet the building's own energy consumption requirements or, in certain situations, fed back into the electrical grid. Rooftop solar PV systems are distributed electricity generation options, which help to meet a building's energy needs, or provide electricity within.

How do you install a rooftop solar PV system?

Take the wires from each solar panel and connect them to the solar inverter, which converts the electricity generated by the array from DC into AC, and then connect the solar inverter to the electrical panel. What are the things to consider before installing Rooftop Solar PV Systems?
