# **Smart Bidding and Procurement of Photovoltaic Containerized Units Compared to Generators**

## Overview

---

Do smart bidding strategies maximize VPP profits?

This study focuses on maximizing VPP profits through smart bidding strategies across Day-Ahead (DA), Real-Time (RT), and Balancing Markets, while considering the operational constraints of Solar Power Plants (SPP), Wind Power Plants (WPP), and microturbines (MT).

What is a virtual power plant (VPP)?

To address this, Virtual Power Plants (VPPs) have emerged as a promising solution. Acting as aggregators, VPPs combine various DERs and controllable loads into a single, coordinated entity capable of participating in energy markets.

Does VPP's strategic bidding strategy change in the ECG market?

The results of Fig. 12 (a) and Fig. 12 (b) show that VPP's strategic bidding strategy in the ECG market has been adjusted accordingly, with a significant reduction in the energy output of thermal units and a greater preference for FRP, compared to participation in the electricity market alone.

Does a VPP bidding strategy work in ancillary services market?

In 2019, Dechang (Yang et al. 2019) examined a VPP bidding strategy in the ancillary services market under carbon-electricity integration trading. The study outlined the VPP's structural and operational framework before formulating a bidding model that captured the market's objectives and constraints.

## Smart Bidding and Procurement of Photovoltaic Containerized Units
