Solar System Simple

Overview

It consists of our sun and eight main planets: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus and Neptune. There are also moons, dwarf planets, asteroids, comets, rocks and dust. What are the components of the Solar System?

The solar system consists of the planets that orbit the Sun as well as such smaller bodies as dwarf planets, comets, and asteroids. The Oort Cloud is part of the solar system. It consists of countless small, icy objects. The solar system consists of the Sun and everything that orbits, or travels around, the Sun.

What is the Solar System & how does it work?

1. Introduction: What is the Solar System?

The Solar System is our home in space. It is a large system of the Sun and everything that moves around it. This includes: Everything is connected through the Sun's gravity. Just like Earth's gravity keeps you on the ground, the Sun's gravity keeps planets, moons, and other objects in orbit.

What is a planetary system?

The solar system is also known as a planetary system. Since the 1990s scientists have found many planetary systems beyond our solar system. In these systems, one or more planets orbit a star—just as the eight planets in our solar system orbit the Sun. These planets are called extrasolar planets.

What is a small body in the Solar System?

Any natural solar system object other than the Sun, a planet, a dwarf planet, or a moon is called a small body; these include asteroids, meteoroids, and comets. Most of the more than one million asteroids, or minor planets, orbit between Mars and Jupiter in a nearly flat ring called the asteroid belt.
