Solar panel glass color standards

Overview

What color are solar panels?

Solar panels are typically black or dark blue because these colors absorb more sunlight than lighter colors. However, solar panels can be any color, including clear. The amount of electricity generated by a solar panel depends on the sunlight it receives, not its color.

Why do solar panels need to be inspected?

Especially critical are those defects that occur at the edges of the glass sheets – an area usually not covered by standard vision systems. Micro-cracks and chips of the solar glass panels are a major cause of glass breakage and their detection is important for assuring highest quality standards.

What is Solar Photovoltaic Glass?

This article explores the classification and applications of solar photovoltaic glass. Photovoltaic glass substrates used in solar cells typically include ultra-thin glass, surface-coated glass, and low-iron (extra-clear) glass.

How much iron is in solar glass?

As one of the most crucial components of solar installations, photovoltaic glass demands high transparency. Therefore, strict requirements are imposed on the iron content in the silicon raw materials used for producing solar glass, with Fe_2O_3 content typically ranging from 140 to 150 ppm.
