# Solar panels installed on roof for thermal insulation

## Overview

---

Rooftop solar panels provide a level of insulation. The solar panels provide a physical cover and reduce the heat energy your roof absorbs. Think of your solar panels as a “shade” on your roof. Do rooftop solar panels provide insulation?

One of the most common questions is whether a rooftop solar array can help with the roof’s insulation. The answer is that rooftop solar panels do provide a degree of insulation. Let’s find out why. The diverse climate of Australia ranges from scorching summers to chilly winters.

Can solar panels be installed on a roof?

Both products guarantee a sustainable and long-lasting fixation of the solar panel on the roof, without compromising the roof’s thermal insulation. Installing solar panels or photovoltaic panels on the roof of a home or building can put the sustainability of the building at risk if it is not done correctly.

How do rooftop solar panels work?

Much of the heat absorbed by your rooftop solar panels is removed by a convection current, which is air movement in the space between the panels and the roof. As air travels between the solar panels and roof materials, the heat is minimised. This leads to reducing the overall temperature of the roof cooling your home.

Do solar panels reduce heat absorbed by a cool roof?

In the absence of photovoltaic (PV) panels, the heat absorbed by a cool roof (characterized by high reflectivity) is reduced by 65.6% compared to a conventional roof (with low reflectivity). However, once PV panels are installed, the disparity in heat gain between roofs with varying reflectivity levels is narrowed to approximately 10%.
