

**EQACC SOLAR**

# **Solar power station and inverter**

## Overview

---

Should I buy an inverter or a portable power station?

Ultimately, the choice between an inverter and a portable power station depends on your specific requirements. If you need a versatile solution that can work with various DC power sources and are comfortable with a more complex setup, an inverter might be the right choice.

What is an inverter used for?

An inverter is a device that converts direct current (DC) power into alternating current (AC) power. It is typically used to convert the DC power produced by a battery or a solar panel into AC power that can be used to power household appliances and electronics.

What is the difference between an inverter and a power station?

**Battery Capacity:** One of the biggest differences between inverters and power stations is the size of the battery. Inverters require an external battery or power source, while power stations include a built-in battery. This means that power stations typically have a larger capacity and can provide power for a longer period of time than an inverter.

How do inverters provide grid services?

In order to provide grid services, inverters need to have sources of power that they can control. This could be either generation, such as a solar panel that is currently producing electricity, or storage, like a battery system that can be used to provide power that was previously stored.
