Solar power with grid backup in America

Overview

How much solar power did the US install in 2025?

LAS VEGAS and WASHINGTON, D.C. — The U.S. solar industry installed nearly 18 gigawatts (GW) of new capacity in the first half of 2025. Even as the Trump administration rolled out a series of anti-clean energy policies, solar and storage still accounted for 82% of all new power added to the grid in its first six months.

Are solar and storage the backbone of America's energy future?

“Solar and storage are the backbone of America’s energy future, delivering the majority of new power to the grid at the lowest cost to families and businesses,” said SEIA president and CEO Abigail Ross Hopper.

Can solar power provide back-up power during a power outage?

By offsetting capital and operational costs through routine day-to-day bill savings, solar-battery systems can provide back-up power during outages without imposing additional expenses on households. Back-up viability refers to a household’s ability to maintain affordable back-up power using solar PV, battery storage or both during grid outages.

How many GW of solar & battery storage will be added in 2024?

Together, solar and battery storage account for 81% of the expected total capacity additions, with solar making up over 50% of the increase. Solar. In 2024, generators added a record 30 GW of utility-scale solar to the U.S. grid, accounting for 61% of capacity additions last year.
