# Suspension of solar cell module exports

## Overview

---

Is the PV module supply chain undergoing transformation in 2024?

The PV module supply chain is undergoing transformation in 2024, marked by oversupply, policy uncertainty, and low prices affecting manufacturing capacity expansion and factory utilisation rates. Oversupply has been central to the solar supply chain since the second quarter of 2023 but there are signs the trend is shifting.

Which country exports the most solar modules in 2024?

In 2024, India saw a notable increase in solar module exports, with the United States emerging as the largest buyer. However, India still faces a significant challenge. While the country has become proficient in manufacturing solar modules, its domestic production of solar cells remains limited and less competitive.

Will US policies affect India's solar module market dynamics?

With the US reducing incentives for solar projects, exports have declined, raising concerns about domestic overproduction. Despite strong domestic demand, the shift in US policies could impact India's solar module market dynamics. Over the past two years, Indian solar module makers have rapidly expanded capacity to around 100 gigawatts (GW).

Are India's solar modules oversupply risks?

India's solar module production has surged to 100 GW, but a report by SBI Capital Markets warns of potential oversupply risks. With the US reducing incentives for solar projects, exports have declined, raising concerns about domestic overproduction.
