

## EQACC SOLAR

**The battery swap station uses solar energy storage batteries**

## Overview

---

What is a battery swapping station?

The ongoing research project features a battery swapping station that provides fully charged batteries to 100 two- and three-wheeler EVs in a designated rural area, as shown in Fig. 4. This existing swapping station network is part of the research initiative and has a tentative payback period of nine years.

How a battery swapping station can reduce the burden on the grid?

So, we need to find some solution for these issues and the best solution is using a battery swapping station instead of a battery charging station which will take just 2 min to swap the battery instead of charging. And to reduce the burden on the grid we can use solar or other renewable energies to charge the batteries at swapping stations.

Is battery swapping station a good solution for battery refueling?

Among various solution the usage of battery swapping station seems more promising as it provide quick battery refueling within a very short time period. The battery swapping station's progress is limited due to the associated investment and operational cost which needs to be addressed to ensure the global acceptance.

What is the difference between battery swapping and charging stations?

Unlike battery swapping, a battery charging station gradually recharges electric car batteries by plugging them into an electrical outlet, making the process slower compared to swapping. Differentiating Between Battery Swapping and Charging Stations While both aim to recharge electric vehicle batteries, they differ significantly.
