

EQACC SOLAR

The cost of generating electricity over the life of a solar panel

Overview

How much does solar PV cost per kWh?

Taking into account the cost of environmental impact, the total cost per kWh for PV and coal-fired power generation is \$3.55/kWh and \$116.25/kWh, respectively. In other countries, the results may have slight difference depending on the manufacturing status of solar PV module production.

Is solar PV more expensive than coal-fired power?

Results show that the cost of PV technology is higher than coal-fired form the base year from 2026 until 2030, taking into account environmental external costs and production costs. However, by 2030, the total cost of coal-fired power will be higher than that of solar PV.

How do I calculate the cost of solar energy?

We can calculate the cost per unit (kWh) of solar energy by dividing the total electricity generated over 25 years by the combined cost of the system and expected maintenance/inverter replacement cost in that period. For a typical 4kWp PV system, this gives a lifetime cost of 9p/kWh for solar (you can see the full calculation on our blog).

Should a solar panel installation be considered an investment?

If an installation is considered an investment, the cost-benefit analysis that goes into a replacement decision will factor the current cost of grid power, the cost of a new panel, the conversion efficiency differential between the old and new panel, and, the associated removal and installation costs.
