The discharge current of the battery cabinet is seriously exceeded

Overview

Does discharge current indicate rated capacity of a Battery?

Since a battery may be rated, i.e. its performance specified, for different discharge times, its rated capacity should normally indicate the current used. The discharge current may alternatively be expressed as a multiple of the rated discharge current.

What is a discharge/charge cycle?

(See BU-703: Health Concerns with Batteries) A discharge/charge cycle is commonly understood as the full discharge of a charged battery with subsequent recharge, but this is not always the case. Batteries are seldom fully discharged, and manufacturers often use the 80 percent depth-of-discharge (DoD) formula to rate a battery.

What is a Battery capacity?

In this example, the battery capacity in Ah, is specified at the 20 hour rate, i.e. for a steady discharge (constant current) lasting 20 hours. The discharge current, in amps (A), is expressed as a fraction of the numerical value of C. Typical tubular positive lead-acid cell behavior at various discharge currents.

What percentage of a battery is fully discharged?

Batteries are seldom fully discharged, and manufacturers often use the 80 percent depth-of-discharge (DoD) formula to rate a battery. This means that only 80 percent of the available energy is delivered and 20 percent remains in reserve.
