

# The function of base station power charging module

## Overview

---

What is power module in a DC charging station?

The power module in a DC charging station consists of AC/DC power stage and DC/DC power stage integrated into the charging station. Each converter is associated with its power stage comprises of power switches and gate driver, current and voltage sensing, and controller.

What does a charging module do?

Function: The charging module is the heart of the charging station, and its main task is to convert the incoming alternating current (AC) into the direct current (DC) required by the electric vehicle. This conversion process must be efficient and stable to ensure that electric vehicles can be charged quickly and safely.

Can a charger module be used on a DC fast charging station?

The charger modules can be used on DC fast charging stations for EVs and E-buses. Note: The charger module does not apply to on-board chargers (inside cars). System space is saved due to a high power density, and each module has a power of 30kW, 40kW or 60kW. Wide input voltage: 260V-530V, designed with input surge protection.

What is a DC charger module?

The charger module is the inner power module for DC charging stations (piles), and convert AC energy into DC in order to charge vehicles. The charger module takes a 3-phase current input and then outputs the DC voltage as 200VDC-500VDC/300VDC-750VDC/150VDC-1000VDC, with an adjustable DC output to meet a variety of battery pack requirements.
