Three-dimensional structure of energy storage container

Overview

As new energy storage devices, lithium-ion batteries and supercapacitors have many advantages, such as high energy density, high efficiency of charge and discharge, and environmental protection. They are widely used in energy, automobile, electronic devices and other fields, attracting researchers' attention. The three-dimensional structure can increase the unit area of electrode materials, effectively improve the utilization efficiency of electrode materials, and significantly improve the electrochemical performance of energy storage devices. In order to further improve the electrochemical performance of energy storage devices and broaden their application fields, it is very necessary to design and prepare electrode materials with 3D structure. This paper mainly reviewed the preparation of lithium-ion batteries and supercapacitors using three-dimensional structured electrode materials, analyzed the advantages and existing problems of different three-dimensional structures, and looked forward to the development direction of three-dimensional energy storage devices. What are 3D polymer based solid-state electrochemical energy storage devices?

Here, we review recent advances in 3D polymer based solid-state electrochemical energy storage devices (mainly in SSCs and ASSLIBs), including the 3D electrode (cathode, anode and binder) and electrolyte (as shown in Fig. 1).

Can 3D polymer be used in solid-state energy storage?

3D polymer applied in solid-state energy storage has been comprehensively reviewed. The synthesis strategy and advantages of 3D polymer for SSCs and SSLIBs are presented. The modification motivation and properties of 3D polymer are stated very carefully. The challenges of future development for 3D polymer is also proposed in this review. 1.

What are three-dimensional (3D) polymers?

Three-dimensional (3D) polymers, an emerging class of organic materials consisting of pure polymers or polymer composites, possessing interconnected 3D networks and highly continuous porous structure, could be

utilized in both electrodes and electrolytes of SSCs and ASSLIBs.

Which polymers can be used to build ternary 3D CP/CNT/graphene networks?

In addition with PANI, other conducting polymers such as polypyrrole , poly (3,4-ethylenedioxythiophene) have also been applied to build ternary 3D CP/CNT/graphene networks, which exhibit promising electrochemical performance. 2.1.2.4. SSCs based on other 3D carbon/CP composites
