Three-phase four-arm NPC grid-connected inverter

Overview

What is model predictive control of a three-level four-leg NPC inverter?

The purpose of the conventional model predictive control of a three-level four-leg NPC inverter is to control the load-side current and to balance the DC-link capacitor voltage. In model prediction control, the rate of change of the current can be expressed as a discrete model using the sampling time T_{sp} .

Which three-level inverter is best for unbalanced loads?

Neutral point clamped (NPC) type three-level inverters are considered to be one of the best topologies for grid-connected and drive applications. However, the conventional three-level three-leg NPC power converter is not a suitable topology for unbalanced loads.

What are three-phase four-wire inverters based on?

Three-phase four-wire inverters based on cascaded three-phase converters with four and three legs. IEEE Trans. Ind. Appl. 53(6), 4. Kouro, S., Perez, M.A., Rodriguez, J., Llor, A.M., Young, H.A.: Model predictive control: MPC's role in the evolution of power electronics. IEEE Ind. Electron. Mag. 9(4), 8–21 (2015) 5.

Is a three-level three-leg NPC power converter suitable for unbalanced loads?

However, the conventional three-level three-leg NPC power converter is not a suitable topology for unbalanced loads. In other words, for applications that require precise control, an improved topology, a four-leg converter, is used. The four-leg topology can provide a new path suitable for unbalanced loads [2, 3].

Three-phase four-arm NPC grid-connected inverter

A Fault-Tolerant Control Strategy for Three-Level Grid

...

Abstract: Three-level NPC inverters have been widely used in grid-connected systems due to their superior performance compared with two-level inverters, but more ...
