# Timor-Leste 21700 battery cell parameters

## Overview

---

Can a 21700 cylindrical battery reflect internal temperature distribution?

To establish a thermal model of the 21,700 cylindrical battery that can reflect the internal temperature distribution, thermophysical parameters including anisotropic thermal conductivity and specific heat capacity are tested through experiments. The thermal model includes the heat generation part and heat transfer part.

What is the thermal modeling process of a 21700 cylindrical battery?

This paper presents the thermal modeling process of a 21,700 cylindrical battery. The thermophysical parameters of the battery were measured by experiments. The specific heat capacity is about  $885 \text{ J kg}^{-1} \text{ K}^{-1}$ . The radial thermal conductivity is about  $0.9 \text{ W m}^{-1} \text{ K}^{-1}$ , and the axial thermal conductivity is about  $24.2 \text{ W m}^{-1} \text{ K}^{-1}$ .

What is a 21700 battery?

The 21700 battery is a cylindrical lithium-ion battery with a diameter of 21mm and a length of 70mm. It offers a nominal voltage of 3.7V and a capacity of up to 5,000mAh, making it a powerful and efficient energy source. Its energy density ranges between 250 Wh/kg and 300 Wh/kg, depending on the chemistry.

What is the temperature difference between A 2C battery and a 21700?

The calculated core and surface temperatures from the battery thermal model are both in good agreement with the measured temperature results. The maximum core temperature of 2C discharging battery is about  $60 \text{ }^{\circ}\text{C}$  and the maximum temperature difference inside the 21,700 battery reaches  $3 \text{ }^{\circ}\text{C}$ .
