

EQACC SOLAR

UPS base station power supply design solution

Overview

What is an uninterruptible power system (UPS)?

Uninterruptible power system (UPS) (1) An electrical system designed to provide instant, transient-free backup power during power failure or fault. Some UPSs also filter and/or regulate utility power (line conditioning). (2) A Device whose sole purpose is to save your equipment, your data and your job. User replaceable.

What is a ups & how does it work?

In general, a UPS protects IT equipment and other electrical loads from problems that plague our electrical supply, performing the following three basic functions: Preventing hardware damage typically caused by surges and spikes. Many UPS models continually condition incoming power as well. Preventing data loss and corruption.

Why do I need an ups?

Many UPS models continually condition incoming power as well. Preventing data loss and corruption. Without a UPS, devices that are subjected to a hard system shutdown can lose data completely or have it corrupted. In conjunction with power management software, a UPS can facilitate a graceful system shutdown.

What is an uninterruptible power supply?

Uninterruptible power supplies provide power to critical loads in the event of a power failure. Unlike emergency generators, UPS systems provide power immediately, but only for a short period of a few minutes – until a backup power supply comes online or until the load completes its shutdown sequence.

UPS base station power supply design solution

UPS Batteries in Telecom Base Stations - leagend

Telecom base stations are typically located in remote areas or urban locations with fluctuating power quality. While the grid supplies the primary power, these base stations must ...
