

**EQACC SOLAR**

# **UPS battery cabinet automatically shuts down**

## Overview

---

UPS self-shutdown typically stems from overheating, overload, battery faults, or internal component failure. What happens if the UPS is in battery mode?

When the UPS system is in battery mode, equipment shuts down immediately. Problem: When the UPS switches to battery mode operation, all devices connected to the UPS power off. Solution: Conduct a self-test (when applicable) and verify the power draw of the attached load doesn't exceed the capacity of the UPS.

Why is my ups not switching to battery power?

A common issue with UPS systems is that they fail to switch to battery power when there is a power outage. This issue is usually caused by a malfunction in the UPS's internal components or a dead battery. Check if the battery is connected properly and functioning. If the battery is defective, replace it.

What should I do if my ups won't power on?

UPS will not power on and the power button is unresponsive. Plug the UPS into a working AC outlet and attempt to power on. If the UPS powers on, allow the unit to charge for at least 24 hours before returning to storage. If the unit does not power on consider replacing the battery. If there is no circuit breaker, continue to the next step.

Why does my ups alarm & power off immediately?

1. After connecting devices to a UPS and powering them on, the UPS alarms and powers off immediately. Problem: The power draw of connected equipment is exceeding the UPS load capacity. Solution: The power rating of the equipment that is plugged into the battery-supported outlets on the UPS must not exceed the UPS capacity.
