What is an uninterruptible power supply (UPS)?

An uninterruptible power supply (UPS) is just such an alternative source. A Uninterruptible Power Supply (UPS) generally consists of a rectifier, battery charger, a battery bank and inverter circuit which converts the commercial ac input into dc suitable for input to the battery bank and the inverter.

What is the internal structure of a ups power supply?

Internal Structure of UPS Power Supply: Rectifiers: Rectifiers convert AC power to DC power. They serve two main functions: converting AC to DC for load supply after filtering, and providing charging voltage to the battery. Inverters: Inverters convert DC power to AC power and consist of an inverter bridge, control logic, and filtering circuit.

What is a dynamic uninterruptible power supply?

For large power supplies, a dynamic uninterruptible power supply (DUPS) can be used. The synchronous motor/alternator is connected to the mains power supply through a choke. Flywheel stored the energy. In the event of a line failure, the stored current control keeps the load driven until the power of the flywheel is exhausted.

Why do we need uninterruptible power supplies?

However, during transmission and distribution, it is subject to voltage sags, spikes and outages that can disrupt computer operations, cause data loss and damage equipment. The uninterruptible power supplies protect the connected equipment from power problems and provide battery backup during power outages.
