# What are the batteries that can store energy

## Overview

---

What type of energy is stored in a battery?

The type of energy stored in a battery is chemical energy, which is converted into electrical energy when the battery is discharged. Essentially, batteries act as energy converters—they take energy from a chemical reaction and release it in a useful form (electrical energy) to power devices.

Do batteries store electricity directly?

Electrode materials determine the battery efficiency, battery capacity and battery life cycle. Thus, batteries do not store electricity directly but store energy in the form of chemical energy, which is then converted into electrical energy when used.

What type of energy does a battery provide?

When a battery is connected to a device, such as your phone or car, it releases the stored chemical energy as electrical energy. The energy is then used to power the device. Therefore, the type of energy a battery provides is electrical energy that has been chemically stored.

Why do we need batteries?

Batteries are at the heart of modern energy storage, transforming chemical energy into the electrical power that fuels our lives. From smartphones to renewable energy systems, their ability to store and deliver energy efficiently makes them indispensable.
