

**EQACC SOLAR**

# **What are the small solar systems**

## Overview

---

What are small Solar System bodies?

Small solar system bodies include comets, asteroids, moons, and the icy objects in the Kuiper Belt and the Oort cloud. Along with the Sun, planets, and dwarf planets, they help make up our Solar System.

What are minor bodies in the Solar System?

This phenomenon likely stirred strong emotions and influenced daily life, beliefs, and interpretations of omens in their societies. This page discusses minor bodies in the solar system, which include small, irregularly shaped objects like asteroids, comets, and meteoroids, as well as Kuiper Belt and Oort Cloud Objects.

What are the relics of Solar System bodies?

R. Schulz, in *Treatise on Geophysics*, 2007 Small solar system bodies, such as comets, asteroids, and TNOs, are believed to be relics of the formation of our planetary system.

How many planets are in our Solar System?

Our Solar System is not just made up of the Sun and eight major planets. There are many small objects that play a big role in understanding how our planet and others formed. These small bodies include Minor Planets, Asteroids, Comets, and interplanetary dust.
