What does PD of energy storage power supply mean

Overview

What is the difference between PPS and PD?

Power Delivery (PD) and Programmable Power Supply (PPS) are two critical protocols for USB-C charging. But how do they differ, and which is better for you?

PD provides fixed voltage levels for universal fast charging, while PPS adds flexible voltage control for faster, cooler, and more efficient charging.

What is PD charging vs PPS charging?

While PD charging is more commonly found in devices, PPS charging offers compatibility with the latest devices that require higher power delivery. PD charging is known for its ability to deliver higher power levels, making it ideal for charging larger devices like laptops and tablets.

What is PPS (programmable power supply)?

PPS (Programmable Power Supply) [^2] is an optional extension of USB PD 3.0 and USB PD 3.1. It allows dynamic control of voltage and current, enhancing charging efficiency. PPS adjusts voltage in small steps of 0.02V, enabling faster and cooler charging. Unlike PD, which works with fixed voltage levels, PPS adds Programmable Power Objects (PPOs).

How does USB PD work?

USB PD works across laptops, phones, and other devices. It provides high power but uses fixed Power Delivery Objects (PDOs). USB PD is widely adopted because of its reliability and high power output. However, its fixed voltage structure limits efficiency for modern devices requiring precise power delivery. What is PPS and why is it important?
