# What does the Guatemala inverter push down mean

## Overview

---

Why does a solar inverter shut down automatically?

Therefore, the inverter shuts down automatically for safety reasons. This is due to the following: the electricity generated by the solar panels is temporarily stored in the inverter. The inverter is constantly measuring the frequency and the voltage from the grid and adjusts the generated power to this.

What happens if an inverter de-Rates or shuts down?

At this point the inverter must either de-rate or shut down to comply with the standards. This can result in a situation where the grid voltage is complaint at 253 Volts, the AC wiring is complaint at 2% voltage rise, and the inverter is compliant at 258 volts. But the inverter is switching off or reducing power.

Why does the inverter shut down automatically if the voltage is too high?

When the voltage is too high, the inverter shuts down automatically for safety reasons. What causes high voltage?

The voltage in the residence is already too high (more than 240V) The allowable voltage in the connection cable of the inverter is being exceeded, because the cable is too thin.

What are the most common power inverter problems?

Over 60% of inverter failures stem from preventable problems such as loose connections, overloaded circuits, or poor maintenance. This guide takes an in-depth look at the most common power inverter problems faced by users and provides actionable solutions backed by specialized knowledge.
